**Galactic Center:** The innermost 10 light years at the center of our galaxy.

**Credit:** NASA/MIT/PSU

This image has been smoothed to bring out the X-ray emission from an extended cloud of hot gas surrounding the supermassive black-hole candidate Sagittarius A* (larger white dot at the very center of the image— a little to the left and above the smallest white dot). This gas glows in X-ray light because it has been heated to a temperature of millions of degrees by shock waves produced by supernova explosions and perhaps by colliding winds from young massive stars.

**Scale:** Image is 1.3 arcmin on a side.
