

A vibrant, multi-colored supernova remnant, likely the Cassiopeia A, is the central focus. It exhibits a complex, shell-like structure with hues of red, orange, yellow, green, and blue. The remnant is set against a dense field of stars of various colors and sizes, creating a rich, starry background.

**In our galaxy,
supernovas occur about
once every 50 years.**

And you thought the wait
at the DMV was long.
