

EAGLE NEBULA

Using Chandra, researchers detected over 1,700 X-ray sources in the field of the Eagle Nebula, which is one of the most iconic images in astronomy. The so-called Pillars of Creation are located in the southern portion of the Eagle Nebula, which is about 7,500 light years from Earth, where stars are being born. Hubble data reveal dusty nebula (brown) and a few stars (pink), while Chandra data expose young stars and other X-ray sources (red, green, and blue).
